

UNIVERSAL
Flick

Next generation Water Diversion System

UNIVERSAL
1 YEAR WARRANTY

Product Benefits

- Outstanding water savings
- Save money on your water bills

Government Rebate

Selected State governments will provide rebates when this system is installed with a rainwater tank to give alternate water supply to the home/ premises.

Flick

– An approved water diversion system
for alternative water supplies

“moving water”

Flick

– An approved water diversion system for alternative water supplies

Product Features

- Capable of full main pressure delivery, not reliant on the pump pressure being higher than the mains.
- Pump protection built in, the unit will cross check flow after pump initiation, and if not present the pump power will be isolated. This protects the pump in the event of poor installation or float switch fault.
- Can be used with any pump that delivers sufficient head
- Variable speed pump drive, this reduces pump cycling when consumer demand is low.
- One piece moulded flow path design, meaning less leakage points. The water course is part of the casing.
- The unit is not constructed from off the shelf components.
- Positive selection between mains and town water. No shandyng that occurs with “the other” products. If tank water is available, this is what is delivered.
- Performance is 60 litres per minute at 850kpa static pressure.

Connection Requirements

- Power requirements - 220V 50 Hz
- Water connection - 20mmdia. BSP female threads.
- Maximum pressure rating - 850kpa

Flick is suitable for both surface mounted and submersible pumping applications. It can be used with the Universal range of pumps or with other pumps that meet with the operational specifications of Flick.

Flick is an automatic mains water back up device used for rainwater harvesting systems. It will optimize collected rainwater, when available and default to a mains water source if tank water is not available or should there be a pump or power failure.
